

DECORATIVE WINDOW FILM CARE & CLEANING

CONGRATULATIONS

You have just had a decorative window film professionally installed by dākisdesigns.

In order for your film to cure properly to the glass, the following steps should be taken:

Do not wash the window film for 30 days after installation.

Depending upon the film type, proper curing of the window film could take up to 140 days.

During the curing process you may see a “white haze” or “fogging” of the material. You may also see “dimples” or “nickels” in the film. These are created by the application solution which will collect and evaporate through the pores of the film. As the film cures it will lay flat to the glass.

Cleaning:

For best results clean your windows with a squeegee and solution of a mild soap and water. If the film does not cover the whole piece of glass, please be conscious of the film edge. When cleaning the film, be sure to wipe from the center out; always stepping down along the film edge, not up.

Most decorative films and vinyls have a scratch resistant finish, but are not scratch proof.

Do Not use any abrasive materials to clean or buff the window glass.

Tape residue is not easily removed. Do not use tape on the window films. Suction cups or 3M Command Strips are recommended.

If you have any questions, please feel free to contact us.
